

Handover document.

Everything the AsiaWorks team needs to own, run and grow the graduate business directory: what was built, how it works, where it lives, and how to keep it healthy.

A directory built for AsiaWorks graduates.

AsiaWorks Direktori is where graduates list their businesses, the public finds them, and graduates find each other to work together. It is live, in Bahasa Indonesia, and works the same on a phone and on a desktop.

23

businesses live in the directory

22

verified graduates behind them

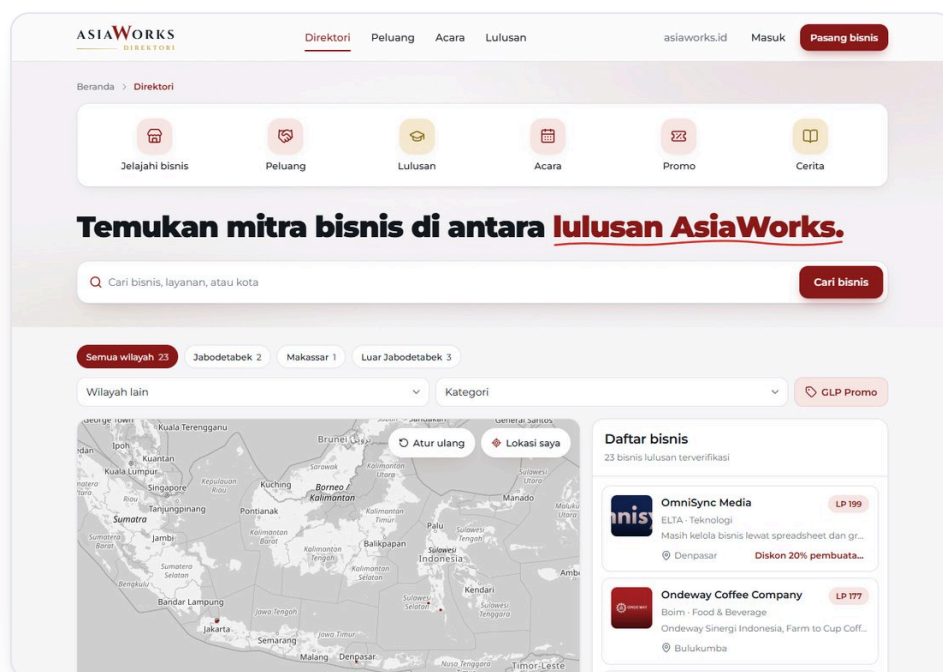

5

cities on the map

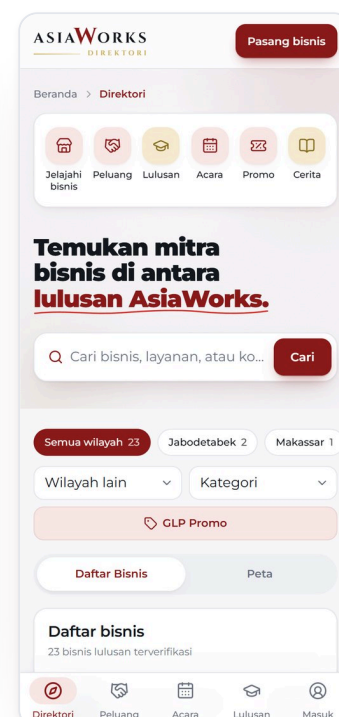

21

changes logged since the first build

Directory figures as shown on the live site on 9 October 2026. Every change is listed in the dev log.

Home on a desktop: search, area filters, the map and the business list side by side.

The same page on a phone, with the bottom navigation bar.

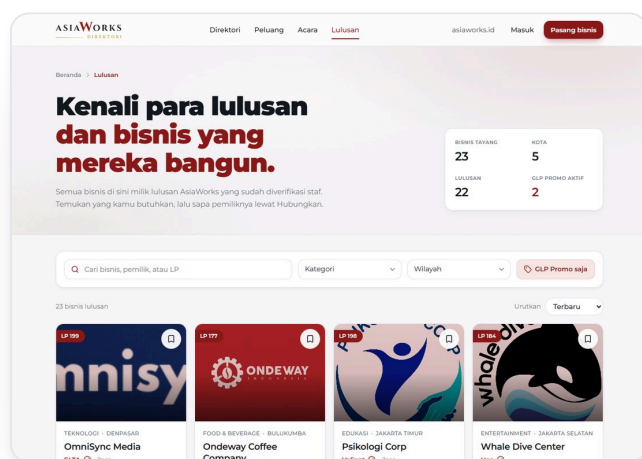

What you are receiving

- The live website at direktori.asiaworks.id, linked to and from asiaworks.id.
- The staff console at `/staff`, where your team verifies graduates and runs the directory.
- The full source code, in a GitHub repository, with setup instructions.
- The database with all its permission rules, plus a script that tests those rules.
- An import tool for the Expo sign-up form's answers, and a 47-second showcase video.
- This document and a dev log sheet (`docs/devlog.csv`) of every change made.

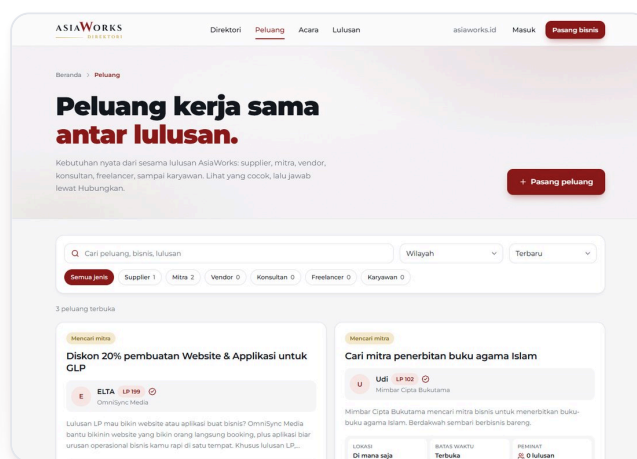

Nine pages, each with one job.

Every page has breadcrumbs and its own search. Visitors can browse all of it without an account.

Address	Name on the site	What it is for
/	Direktori	Home. Banner slider, shortcuts, search, area and category filters, the map with pins and the business list, browse by category, latest Peluang, GLP Promo and events.
/bisnis/...	Halaman bisnis	One business: description, pictures, links, locations on a map, the owner, its promo, and the Hubungkan and Lihat kontak buttons.
/peluang	Peluang	Partner requests from graduates: supplier, mitra, vendor, konsultan, freelancer or karyawan.
/acara	Acara	Meetups, workshops and gatherings with RSVP, plus collaboration stories and "Usulkan acara" for graduates who want to host.
/lulusan	Lulusan	Meet the graduates: every live business as a card, searchable by name, owner or batch (LP, IA, IB).
/daftar	Pasang bisnis	Sign-up in three short steps: account, programs and batch, then the business.
/masuk	Masuk	Member login, with "Lupa kata sandi".
/akun	Dasbor	The member's dashboard: Peluang, Bisnis, Koneksi and Akun.
/staff	Konsol staf	Staff login and the console. A member's account is refused here.

Lulusan: live counts at the top, every verified business below.

Peluang: real needs posted by graduates, answered through Hubungkan.

What each person can do.

There are four kinds of people on the site. Each one sees and does more than the one before.

Visitor · no account

- Search by keyword, category and area (Jabodetabek, Makassar, Luar Jabodetabek, or any other region).
- See businesses on a map or as a list, and open any business page.
- Browse Peluang, events, GLP Promo and collaboration stories.
- Tap an owner's name to see "Profil lulusan": name, programs and batch.

Member · signed up

- Sign up in three steps and choose the programs finished (IB, IA, LP). LP needs its batch number.
- Send a *Hubungkan* request to any business, or answer a Peluang.
- RSVP to events, with a waiting list when an event is full.
- Save businesses to come back to, and report a listing to staff.

Graduate · verified by staff

- List one or more businesses. Several branches are one listing with several locations.
- Put a pin on the map, show only an approximate area, or mark the business "Online saja".
- Post Peluang, also without a business listing, and offer a GLP Promo to fellow graduates.
- Open a business's contact through "Lihat kontak". The owner sees who looked.
- Offer to host an event in their city.

Business owner · in the dashboard

- Edit the listing at any time. Changes go live at once.
- Switch a listing off and on. Off hides it everywhere and keeps the content.
- See how many people viewed it, opened its contact and asked to connect.
- Accept or decline *Hubungkan* requests. Accepting opens both sides' contacts.
- Delete a listing or the whole account, for good.

How graduates work together

Hubungkan	A short request from one member to a business. Only the owner answers it. Staff cannot read these.
Peluang	A real need, posted publicly: a supplier, partner, vendor, consultant, freelancer or hire.
GLP Promo	A deal a business offers to fellow graduates, shown on its card. The owner can switch it off.
Acara	Events with RSVP, a seat limit and a waiting list.
Cerita	A collaboration story between two businesses, written by staff and published only when both owners agree.

The staff console, section by section.

Staff sign in at `/staff`. The first screen shows what is waiting for a decision, and a red badge on each section counts its queue. On a phone the sections sit in a bar at the bottom.

Ringkasan, shown here with demo data. Every number opens the list behind it.

Ringkasan Queues, directory numbers, latest activity.

Verifikasi Approve or reject a graduate's program and batch.

Moderasi Review businesses, Peluang and Promo; suspend or reinstate; handle reports.

Acara Create events, see RSVPs, review hosting offers.

Akun Every account, its contact, status and businesses.

Bisnis Every business as Tayang or Tidak tayang, with the reason.

Cerita Write collaboration stories.

Banner The home slider: announcements and ads for a business.

Privasi Account deletion requests.

Log audit Who did what, and when. The latest 500 actions.

A normal week for staff

- **Verifikasi:** check new sign-ups against the batch records and approve or reject them.
- **Moderasi:** review new businesses, Peluang and Promo, and answer reports.
- **Banner:** keep the slider current. A picture of 1200 × 400 fits best, with its message inside the picture.
- **Acara:** add upcoming events so the page is never empty.
- **Privasi:** act on deletion requests from here, not from the Supabase dashboard. Only this route also removes the person's stored files.

Check the four Auto Approve switches

The console has four switches made for demos: Auto Approve Graduates Request, Auto Approve Bisnis, Auto Approve Peluang and Auto Approve Promo. While one is on, whatever is sent goes live with no review.

For normal running, keep all four off. They are in Verifikasi and Moderasi, and every automatic approval is written to the audit log.

The rules that **protect members.**

These rules live inside the database, not in the screens. Someone who bypasses the website and talks to the database directly meets the same rules.

Publishing needs two yeses

A business appears only with the owner's consent and a moderator's approval, and only while its owner is a verified graduate.

Graduate status comes from staff

Never from what a person types. Programs and batch numbers lock once the request is sent. Withdrawing the status takes that person's listings down.

Contacts are private

Phone numbers and business contacts are stored encrypted. They reach another person only through "Lihat kontak" (verified graduates, and it is recorded) or an accepted Hubungkan request.

A suspended listing vanishes everywhere

Search, the map, Peluang, promos, stories and ads all drop it at the same moment. The same goes for a listing its owner switched off.

Location can be approximate

A home business can show an area instead of a point. The database rounds the point to about 1 km before storing it, so the exact spot is never kept.

Deletion is real

Deleting a listing or an account removes the data and the stored pictures. Only a payment's amount and date would remain, detached from the person.

Banners and ads belong to staff

Members cannot add, change or remove one. An ad carries the label "Iklan" and leaves the home page while its business is not public.

Staff actions are logged

Approvals, rejections, suspensions and deletions are written to the audit log by the database itself.

Who can see what

Information	Visitor	Member	Verified graduate	Staff
Live businesses, Peluang, events	Yes	Yes	Yes	Yes
Owner's name, programs, batch	Yes	Yes	Yes	Yes
Business contact	No	After an accepted request	Through Lihat kontak	Yes
Hubungkan requests	No	Only the two people involved		No
Drafts and switched-off listings	No	Only their owner		Yes

Proving the rules still hold. The project includes a test, `npm run check`, that signs up its own test accounts, tries each rule as a real visitor, member, graduate and staff member, then removes everything it made. Run it after any change to the database.

How it is built, and where it lives.

The directory is deliberately small: one web application and one database service. There is no server of our own to patch or restart.

Part	What is used	What it does
Website	Next.js 16, React 19, TypeScript, Tailwind CSS 4	All nine pages. The whole feature is one folder, <code>app/(aw)</code> , so it can be moved into another Next.js site.
Hosting	Vercel	Builds and publishes the site every time the <code>main</code> branch changes.
Database and login	Supabase (PostgreSQL)	Accounts, all directory data, the permission rules, search, and picture storage.
Map	Leaflet with OpenStreetMap	The map and its pins. No API key and no usage fee.
Source code	GitHub	Repository <code>insurgent6a-pixel/AWDirektori</code> . Each change arrives as a pull request.
Domain	<code>direktori.asiaworks.id</code>	A subdomain of <code>asiaworks.id</code> pointing at Vercel.

How a change reaches the live site

- The change is made on its own branch and opened as a pull request on GitHub.
- Someone with rights approves and merges it into `main`.
- Vercel builds `main` and the live site updates within a few minutes.
- A change to the database comes as a dated file in `supabase/upgrades/`. It is pasted into Supabase's SQL Editor, oldest first. Each file is safe to run twice and deletes nothing.

The site's two Supabase settings are stored in Vercel and are built into the site, so changing one needs a redeploy.

Access handover checklist

Tick each one when AsiaWorks holds an owner-level login.

- ☐ **GitHub:** the repository, with a named AsiaWorks owner. It is public today; decide whether to make it private.
- ☐ **Vercel:** the project and its environment variables.
- ☐ **Supabase:** the project, including the service role key, kept private.
- ☐ **Domain:** the DNS record for `direktori.asiaworks.id`.
- ☐ **Staff console:** at least two staff accounts, each a named person.
- ☐ **Supabase plan:** confirmed, with backups (see page 9).
- ☐ **All database upgrade files** confirmed as run on the live project.

Adding a staff account

The person signs up at `/daftar` (the first step is enough). Someone with Supabase access then sets that account's role to `staff` in the SQL Editor; the exact line is in the README. After that they sign in at `/staff`.

What it is sized for, and what it leaves out.

The brief asked for a light, simple build for 35 to 100 members. These are the choices that kept it light. None of them is a problem today; each has a clear upgrade when the directory grows.

Choice made	What it means today	When to revisit
Search returns up to 200 businesses	Every business fits in one result, so search and the map feel instant.	When live businesses approach 200.
Peluang and Acara filter in the browser	One fetch, then filtering with no waiting.	Past a few hundred Peluang or events.
Page views are a simple counter	Counted once per browser session. Good for a rough picture, not for billing.	If view numbers are ever sold to advertisers.
Audit log shows the latest 500 actions	Older actions stay stored; the screen just does not list them.	When staff need to look further back.
Pages are drawn in the browser	Fast for people. Google may index individual business pages less fully.	When being found on Google matters for each business.
Deleted pictures linger briefly	A deleted picture is gone from storage at once, but its direct address can answer for up to a minute.	No action needed.

Not included in this build

Online payments

No payment provider is connected and no screen asks for money. Staff put ads up by hand. The database is ready for payments, so connecting a provider later does not need a rebuild.

Email sending at volume

Supabase's built-in mailer sends only a few messages an hour. For password resets to work reliably as membership grows, connect AsiaWorks' own email service (SMTP) in Supabase.

Notifications

Members see new Hubungkan requests as a badge in their dashboard. The site does not send email or WhatsApp alerts.

A member's own data export

Members can ask for their account to be deleted from the dashboard. A self-service copy of their data is not offered.

Keeping it healthy.

Most of the work is the staff's weekly routine on page 5. The technical upkeep below is small, but skipping it is how a site quietly ages.

How often	Task	Why it matters
Weekly	Clear the Verifikasi and Moderasi queues. Open the live site and try one search.	Graduates wait on staff to go live.
Monthly	Check the Supabase dashboard: database size, storage used, and that a recent backup exists.	Pictures and data grow with every listing.
Monthly	Read the audit log for anything unexpected, and confirm the four Auto Approve switches are off.	Catches a switch left on after a demo.
Quarterly	Update the site's software packages (Next.js, React, Supabase client), then run the build and <code>npm run check</code> .	Security fixes arrive as package updates.
Quarterly	Review staff accounts. Remove the role from people who left the team.	Staff can see every account and contact.
Yearly	Confirm the domain and all service accounts are still owned by a current AsiaWorks person.	Logins tied to one person are the usual way a site is lost.
After any change	Run <code>npm run devlog</code> so the dev log sheet stays complete.	One place to see what changed and when.

Decide the Supabase plan now

At the time of writing, a Supabase project on the free plan is paused after about a week with no activity and has no automatic backups. For a site holding members' details, confirm the plan and make sure daily backups are on.

If something looks wrong

- **"Data belum bisa dimuat":** the site cannot reach Supabase. Check that the project is running.
- **A change is not showing:** check the latest deployment in Vercel.
- **A business is missing:** look it up in Bisnis in the console. It states the reason.

Running costs to expect

There is no licence fee for the directory itself, and the map is free. The recurring costs are the Vercel and Supabase plans and the asiaworks.id domain. Which plans fit depends on traffic and on the backup decision above, so they are best confirmed together at handover.

Four ways to look after it.

The directory is yours either way. The options differ in who does the technical upkeep on page 9 and who is on hand when something needs changing.

Option A

Self-managed

For a team with its own developer who knows React and SQL.

- AsiaWorks holds every login and does all upkeep.
- This document, the README and the dev log are the guide.
- One handover session to walk through the code and console.

No ongoing fee. Help afterwards is quoted per request.

Option B

On call

For a stable site that needs a hand only now and then.

- Fixes and small changes whenever you ask.
- Each job quoted before work starts.
- Routine upkeep stays with AsiaWorks.

Pay per job. No guaranteed response time.

Option C · suggested for the first three months

Care plan

For peace of mind while the directory fills up after launch.

- All the monthly and quarterly upkeep on page 9, done for you.
- Backups checked, packages updated, rules re-tested.
- A set amount of small changes each month.
- Priority response when something breaks.
- A short monthly note: what was done, how the directory grew.

Fixed monthly fee, to be agreed.

Option D

Care and growth

For a directory AsiaWorks wants to keep building on.

- Everything in the Care plan.
- A planned feature each cycle, chosen together from page 11.
- Staff training when the console changes.
- A quarterly review of usage and what members ask for.

Monthly fee plus an agreed feature budget.

At a glance

	A · Self-managed	B · On call	C · Care plan	D · Care and growth
Routine upkeep	AsiaWorks	AsiaWorks	OmniSync Media	OmniSync Media
Fixes	AsiaWorks	Per job	Included	Included
Small changes	AsiaWorks	Per job	Monthly allowance	Monthly allowance
New features	AsiaWorks	Per job	Quoted separately	Planned each cycle
Monthly report	None	None	Yes	Yes, plus quarterly review

Where it can go from here.

Ideas the current build already makes room for, roughly in the order they would pay off.

Idea	What members or staff would get	Groundwork already there
Email or WhatsApp alerts	A member hears about a Hubungkan request without opening the dashboard.	Requests and their status are stored.
AsiaWorks' own email service	Password resets and confirmations that always arrive.	A setting in Supabase.
Business pages on Google	Each business can be found by people searching outside the directory.	Pages have stable addresses.
Paid ads with online payment	A business books and pays for a banner slot itself.	Payments table and rules.
Paging for a larger directory	Search stays fast beyond 200 businesses.	Search runs in the database.
Bringing in the Expo sign-ups	Graduates who filled in the form at Expo get an account and a listing without typing it again.	The import tool is built.

The dev log

Every change since the first build is listed in `docs/devlog.csv`, which opens in Excel or Google Sheets. Each row has the date, the part of the site, what changed and why, whether it is live, and a reference to the pull request and the exact code change.

The sheet is written from the project's own history, so it cannot drift from what was really done. After new work, `npm run devlog` brings it up to date.

21

changes between 2 and 8 October 2026

20 live. 1 waiting for approval: the larger map dots for approximate locations.

Handover sign-off

Signing below confirms that the access checklist on page 7 is complete and a maintenance option on page 10 has been chosen.

For AsiaWorks Indonesia · name, signature, date

For OmniSync Media · name, signature, date
